through the point of the male organ, to make water when not in an erect state, and when it is erect the point will do. The oval apertures must not let out the male organ in an erect state. No. 3 is the cushion at the pubis; it does not go any farther than the top of the testicles; it does not require to be very tight on the under part of the male organ immediately above the testicles, which it might derange. Nos. 4 are the spaces between.

MALE PRO-  
TECTING AP-  
PARATUS—  
ACCOUNT OF  
IT.

The above is the shape of an apparatus to cover or protect the male organ,—it is made of some substance that is not elastic, as, if it were elastic, they could press it on the male organ so as to masturbate it, or cause pleasurable and licentious sensations. As the penis is oftener small than erect, and as this apparatus would bulge out if always in the erect thickness, if possible it might be made to collapse or go together at its non-erection, or when it is small. It must always be the same length that the penis is at when it is erect. If they could diminish its length as they pleased, or rather if it diminished or became shorter of itself, they could then masturbate themselves; but when it only diminishes, or falls, or collapses of itself in its thickness or roundness, they cannot push it up and down in its length to masturbate themselves, and cause pleasurable sensations; it may therefore, if possible, be elastic, or rather hinged some way, so as to collapse in its thickness on each side of the apparatus, but yet it must not diminish in its breadth, or from side to side, or in its length, but only in its thickness: but it must have no such hinge or elasticity to diminish its length from what it is at full size or erection. Let us suppose two separate pieces of wood the length of the penis, the one on the upper part of it, and the other piece on the under part, and let us suppose that these two pieces of wood or pasteboard, &c., are joined to each other at the sides by leather, or any thick, strong, pliable material, and being loose enough to allow of the boards to be raised when the organ is erect or falling when the organ is collapsed, then we may have a good idea of the kind of thing required; but the wood or boards must be a little broader than the breadth of the organ when erect. The inside must be lined with some smooth material, so as not to hurt the penis or male organ of generation; and that it may not take in much wet, the outside must
