[Faint handwritten notes at the bottom of the page]

1. *Chlorophyll a* (Chl a) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl a is essential for the light-dependent reactions of photosynthesis, where it converts light energy into chemical energy in the form of ATP and NADPH.

It was long, I remember quite well the conversation
of a night and a storm of rain, just when the
light of the morning was coming in, and the sun was
in the sky, and the wind was blowing from the north
and the rain was falling from the clouds.
